

FARM MACHINERY AND EQUIPMENT
1978 COST ESTIMATES

Adopted for Ohio
by
Allan E. Lines
Extension Economist
Farm Management

Department of Agricultural Economics and Rural sociology,
The Ohio State University, Columbus, Ohio, June 1978.

INTRODUCTION ^{1/}

The following information is included as an aid in estimating farm machinery costs for 1978. The costs are determined by formula and were updated January 1978. They represent an average cost for a specific piece of machinery. An assumption is made as to the annual use of each machine. The amount of annual use is an estimate of annual hours of use that a commercial farmer would use that particular machine in one year.

These machinery costs are intended to be average estimates for the agricultural industry. Each machine is depreciated for 10 years with a salvage value of 10% and investment credit taken at the full 10% rate. It is assumed that a piece of equipment once purchased new will be used commercially for 10 years even though it may be owned by several people.

All power units, tractors, combines, trucks, etc. are assumed to be diesel powered. An estimate of gasoline consumption might be made by multiplying the diesel fuel consumption by a factor of 1.36. Lubrication cost is assumed to be 10% of fuel cost.

Repairs are based on standard repair formulas listed in the 1976 Agricultural Engineering Yearbook and illustrated in the MACHINE User's Guide.

Tables 7 and 8 provide estimates of total function costs for the specific pieces of equipment on a per hour and per acre basis. Total function costs are estimates of all the costs associated with doing a specific function such as plowing, discing, spraying, etc. Total function costs include overhead and operating costs of the tractor (if used) and the piece of equipment, plus the cost of labor to operate the equipment.

Table 9 provides estimates of fuel consumption per acre based on .06 gallons of diesel fuel per horsepower hour. Fuel price is included at 45¢ per gallon.

Tables 10 and 11 include estimates of suggested custom rates on a per hour and a per acre basis. These suggested custom rates include all costs plus a 20% addition to cover risks and provide a reasonable profit. Some pieces of equipment are assumed to be used over more acres when used by a custom operator so that the annual overhead may be spread over more hours or acres than would be the case for the average farm operator. This indicates somewhat lower costs because of reduced per unit overhead as compared to the commercial operator. Table 11 includes estimates of cash operating costs, total function costs, and suggested custom rates for each piece of equipment. The cash operating costs (out of pocket costs) include fuel, oil, repairs and maintenance for each set of equipment. Labor is not included in the cash operating costs but is included in the total function costs and suggested custom rates. The labor wage rate for unskilled labor is \$3.50 per hour and a charge of \$4.50 per hour is used for skilled labor (see table 6).

These cost estimates are not intended to be indicative of everyone's cost but are intended to be used as a guide in planning the cropping operation. Each individual has unique costs because of his buying power, repair program, average annual use, and overall replacement program.

^{1/} This material was developed by F. J. Benson, Agricultural Economist at the University of Minnesota.

TABLE 1

ESTIMATED NEW COST, AVERAGE INVESTMENT, ANNUAL HOURS USE, ANNUAL FIXED COST,
AND RESULTING FIXED COST PER HOUR FOR SPECIFIED SIZES OF TRACTORS.
